Honeywell Silent Knight 6000 Series Firmware 6.0.20 Release Notes

The Honeywell Silent Knight 6000 Series addressable fire alarm control panels were designed to accept panel firmware updates through a connected PC. To update the panel firmware, download the latest "Firmware Update Utility 6.0.20 Application.exe" file to a PC, connect the PC to a 6000 Series fire panel using a USB cable and run the Update Utility file.

Updating your panel to the latest released firmware is highly recommended in order to fix known issues and add additional features and product support. Please note: upgrading firmware may take up to 20 minutes and may cause the panel to reboot several times.

Please visit www.silentknight.com to download the latest panel firmware and programming software.

Panel firmware version 6.0.20 includes the following fixes and modifications:

- Corrects an issue where some events were not being reported to the central station in certain instances
- Corrects an issue where system events may not have printed or been stored in panel history properly
- Resolves the "Upload Unavailable" error
- Improves user experience and system stability with refined programming

Note: If Silent Knight 6000 Series panels are connected through a common communications/annunciation linked system, all panels in the system must be using the same firmware version.
