## **Honeywell Silent Knight 6000 Series Firmware 6.0.21 Release Notes**

The Honeywell Silent Knight 6000 Series addressable fire alarm control panels were designed to accept panel firmware updates through a connected PC. To update the panel firmware, download the latest "Firmware Update Utility 6.0.21 Application.exe" file to a PC, connect the PC to a 6000 Series fire panel using a USB cable and run the Update Utility file.

Updating your panel to the latest released firmware is highly recommended in order to fix known issues and add additional features and product support. Please note: upgrading firmware may take up to 20 minutes and may cause the panel to reboot several times.

Please visit [www.silentknight.com](http://www.silentknight.com) to download the latest panel firmware and programming software.

Panel firmware version 6.0.21 includes the following updates:

- "Auto Display Event" now auto-scrolls the highest priority event with point description after going into alarm
- Notification appliance circuits (NACs) no longer report being open after a panel reset
- "AC Power Loss" trouble generated from system battery voltage exceeding 30 VDC now reported as "Battery" trouble
- Panel and remote annunciator messaging for disabled and active points are now in-sync
- B200SR(-WH/-IV) and B200SR-LF(-WH/-IV) sounders will no longer start sounding during firmware updates
- Prefixes can now be deleted using the panel keypad
- LEDs for sensors and modules now turn off when panel is reset when using I/O Point Control

**Note: If Silent Knight 6000 Series panels are connected through a common communications/annunciation linked system, all panels in the system must be using the same firmware version.**
